## MSP430™ SoC with RF Core

### FEATURES

- True System-on-Chip (SoC) for Low-Power Wireless Communication Applications
- Wide Supply Voltage Range: 1.8 V to 3.6 V
- Ultra-Low Power Consumption:
  - CPU Active Mode (AM): 160  $\mu$ A/MHz
  - Standby Mode (LPM3 RTC Mode): 2.0  $\mu$ A
  - Off Mode (LPM4 RAM Retention): 1.0  $\mu$ A
  - Radio in RX: 15 mA, 250 kbps, 915 MHz
- MSP430™ System and Peripherals
  - 16-Bit RISC Architecture, Extended Memory, up to 20-MHz System Clock
  - Wake-Up From Standby Mode in Less Than 6  $\mu$ s
  - Flexible Power Management System with SVS and Brownout
  - Unified Clock System with FLL
  - 16-Bit Timer TA0, Timer\_A with Five Capture/Compare Registers
  - 16-Bit Timer TA1, Timer\_A with Three Capture/Compare Registers
  - Hardware Real-Time Clock
  - Two Universal Serial Communication Interfaces
    - USCI\_A0 supporting UART, IrDA, SPI
    - USCI\_B0 supporting I<sup>2</sup>C, SPI
  - 12-Bit A/D Converter With Internal Reference, Sample-and-Hold, and Autoscan Features (CC430F613x and CC430F513x Only)
  - Comparator
  - Integrated LCD Driver With Contrast Control for up to 96 Segments (CC430F61xx Only)
  - 128-bit AES Security Encryption/Decryption Coprocessor
  - 32-Bit Hardware Multiplier
  - Three-Channel Internal DMA
  - Serial Onboard Programming, No External Programming Voltage Needed
  - Embedded Emulation Module (EEM)
- High-Performance Sub-1-GHz RF Transceiver Core
  - Same as in CC1101
  - Wide Supply Voltage Range: 2.0 V to 3.6 V
  - Frequency Bands: 300 MHz to 348 MHz, 389 MHz to 464 MHz, and 779 MHz to 928 MHz
  - Programmable Data Rate From 0.6 kBaud to 500 kBaud
  - High Sensitivity (-117 dBm at 0.6 kBaud, -111 dBm at 1.2 kBaud, 315 MHz, 1% Packet Error Rate)
  - Excellent Receiver Selectivity and Blocking Performance
  - Programmable Output Power Up to +12 dBm for All Supported Frequencies
  - 2-FSK, 2-GFSK, and MSK Supported as well as OOK and Flexible ASK Shaping
  - Flexible Support for Packet-Oriented Systems: On-Chip Support for Sync Word Detection, Address Check, Flexible Packet Length, and Automatic CRC Handling
  - Support for Automatic Clear Channel Assessment (CCA) Before Transmitting (for Listen-Before-Talk Systems)
  - Digital RSSI Output
  - Suited for Systems Targeting Compliance With EN 300 220 (Europe) and FCC CFR Part 15 (US)
  - Suited for Systems Targeting Compliance With Wireless M-Bus Standard EN 13757-4:2005
  - Support for Asynchronous and Synchronous Serial Receive/Transmit Mode for Backward Compatibility With Existing Radio Communication Protocols
- Family Members are Summarized in [Table 1](#).
- For Complete Module Descriptions, See the *CC430 Family User's Guide* ([SLAU259](#)).

## DESCRIPTION

The Texas Instruments CC430 family of ultra-low-power microcontroller system-on-chip with integrated RF transceiver cores consists of several devices featuring different sets of peripherals targeted for a wide range of applications. The architecture, combined with five low-power modes, is optimized to achieve extended battery life in portable measurement applications. The device features the powerful MSP430™ 16-bit RISC CPU, 16-bit registers, and constant generators that contribute to maximum code efficiency.

The CC430 family provides a tight integration between the microcontroller core, its peripherals, software, and the RF transceiver, making these true system-on-chip solutions easy to use as well as improving performance.

The CC430F61xx series are microcontroller system-on-chip configurations combining the excellent performance of the state-of-the-art CC1101 sub-1-GHz RF transceiver with the MSP430 CPUXV2, up to 32 kB of in-system programmable flash memory, up to 4 kB of RAM, two 16-bit timers, a high-performance 12-bit A/D converter with eight external inputs plus internal temperature and battery sensors on CC430F613x devices, comparator, universal serial communication interfaces (USCI), 128-bit AES security accelerator, hardware multiplier, DMA, real-time clock module with alarm capabilities, LCD driver, and up to 44 I/O pins.

The CC430F513x series are microcontroller system-on-chip configurations combining the excellent performance of the state-of-the-art CC1101 sub-1-GHz RF transceiver with the MSP430 CPUXV2, up to 32 kB of in-system programmable flash memory, up to 4 kB of RAM, two 16-bit timers, a high performance 12-bit A/D converter with six external inputs plus internal temperature and battery sensors, comparator, universal serial communication interfaces (USCI), 128-bit AES security accelerator, hardware multiplier, DMA, real-time clock module with alarm capabilities, and up to 30 I/O pins.

Typical applications for these devices include wireless analog and digital sensor systems, heat cost allocators, thermostats, metering (AMR/AMI), smart grid wireless networks, etc.

Family members available are summarized in [Table 1](#).

For complete module descriptions, see the *CC430 Family User's Guide*, literature number [SLAU259](#).

## SHORT-FORM DESCRIPTION

### Sub-1-GHz Radio

The implemented sub-1-GHz radio module is based on the industry-leading CC1101, requiring very few external components. Figure 1 shows a high-level block diagram of the implemented radio.

Figure 1. Sub-1-GHz Radio Block Diagram

The radio features a low-IF receiver. The received RF signal is amplified by a low-noise amplifier (LNA) and down-converted in quadrature to the intermediate frequency (IF). At IF, the I/Q signals are digitized. Automatic gain control (AGC), fine channel filtering, demodulation bit/packet synchronization are performed digitally.

The transmitter part is based on direct synthesis of the RF frequency. The frequency synthesizer includes a completely on-chip LC VCO and a 90 degrees phase shifter for generating the I and Q LO signals to the down-conversion mixers in receive mode.

The 26-MHz crystal oscillator generates the reference frequency for the synthesizer, as well as clocks for the ADC and the digital part.

A memory mapped register interface is used for data access, configuration and status request by the CPU.

The digital baseband includes support for channel configuration, packet handling and data buffering.

## CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses, and can be handled with all instructions.

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data.

## Operating Modes

The CC430 has one active mode and five software-selectable low-power modes of operation. An interrupt event can wake up the device from any of the low-power modes, service the request, and restore back to the low-power mode on return from the interrupt program.

The following six operating modes can be configured by software:

- Active mode (AM)
  - All clocks are active
- Low-power mode 0 (LPM0)
  - CPU is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
  - FLL loop control remains active
- Low-power mode 1 (LPM1)
  - CPU is disabled
  - FLL loop control is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
- Low-power mode 2 (LPM2)
  - CPU is disabled
  - MCLK and FLL loop control and DCOCLK are disabled
  - DCO's dc-generator remains enabled
  - ACLK remains active
- Low-power mode 3 (LPM3)
  - CPU is disabled
  - MCLK, FLL loop control, and DCOCLK are disabled
  - DCO's dc-generator is disabled
  - ACLK remains active
- Low-power mode 4 (LPM4)
  - CPU is disabled
  - ACLK is disabled
  - MCLK, FLL loop control, and DCOCLK are disabled
  - DCO's dc-generator is disabled
  - Crystal oscillator is stopped
  - Complete data retention

## Interrupt Vector Addresses

The interrupt vectors and the power-up start address are located in the address range 0FFFFh to 0FF80h. The vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

(2) A reset is generated if the CPU tries to fetch instructions from within peripheral space.

(3) (Non)maskable: the individual interrupt-enable bit can disable an interrupt event, but the general-interrupt enable cannot disable it.

(4) Reserved interrupt vectors at addresses are not used in this device and can be used for regular program code if necessary. To maintain compatibility with other devices, it is recommended to reserve these locations.

## Bootstrap Loader (BSL)

The BSL enables users to program the flash memory or RAM using various serial interfaces. Access to the device memory via the BSL is protected by an user-defined password. BSL entry requires a specific entry sequence on the  $\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$  and  $\text{TEST}/\text{SBWTCK}$  pins. For complete description of the features of the BSL and its implementation, see the *MSP430 Programming Via the Bootstrap Loader User's Guide*, literature number [SLAU319](#).

**Table 6. UART BSL Pin Requirements and Functions**

## JTAG Operation

### JTAG Standard Interface

The CC430 family supports the standard JTAG interface which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin is used to enable the JTAG signals. In addition to these signals, the  $\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$  is required to interface with MSP430 development tools and device programmers. The JTAG pin requirements are shown in [Table 7](#). For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*, literature number [SLAU278](#).

**Table 7. JTAG Pin Requirements and Functions**

DEVICE SIGNAL	Direction	FUNCTION
PJ.3/TCK	IN	JTAG clock input
PJ.2/TMS	IN	JTAG state control

TEST/SBWTCK	IN	Enable JTAG pins
$\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$	IN	External reset
VCC		Power supply
VSS		Ground supply

### Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the CC430 family supports the two wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430 development tools and device programmers. The Spy-Bi-Wire interface pin requirements are shown in [Table 8](#). For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*, literature number [SLAU278](#).

## Flash Memory

The flash memory can be programmed via the JTAG port, Spy-Bi-Wire (SBW), or in-system by the CPU. The CPU can perform single-byte, single-word, and long-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (Info A to Info D) of 128 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments Info A to Info D can be erased individually, or as a group with the main memory segments. Segments Info A to Info D are also called *information memory*.
- Segment A can be locked separately.

## RAM Memory

The RAM memory is made up of n sectors. Each sector can be completely powered down to save leakage, however, all data is lost. Features of the RAM memory include:

- RAM memory has n sectors of 2k bytes each.
- Each sector 0 to n can be complete disabled, however data retention is lost.
- Each sector 0 to n automatically enters low power retention mode when possible.

## Peripherals

Peripherals are connected to the CPU through data, address, and control busses and can be handled using all instructions. For complete module descriptions, see the *CC430 Family User's Guide*, literature number [SLAU259](#).

### Oscillator and System Clock

The Unified Clock System (UCS) module includes support for a 32768-Hz watch crystal oscillator, an internal very-low-power low-frequency oscillator (VLO), an internal trimmed low-frequency oscillator (REFO), an integrated internal digitally-controlled oscillator (DCO), and a high-frequency crystal oscillator. The UCS module is designed to meet the requirements of both low system cost and low-power consumption. The UCS module features digital frequency locked loop (FLL) hardware that, in conjunction with a digital modulator, stabilizes the DCO frequency to a programmable multiple of the watch crystal frequency. The internal DCO provides a fast turn-on clock source and stabilizes in less than 5  $\mu$ s. The UCS module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32768-Hz watch crystal, a high-frequency crystal, the internal low-frequency oscillator (VLO), or the trimmed low-frequency oscillator (REFO).
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced by same sources made available to ACLK.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources made available to ACLK.
- ACLK/n, the buffered output of ACLK, ACLK/2, ACLK/4, ACLK/8, ACLK/16, ACLK/32.

### Power Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device and contains programmable output levels to provide for power optimization. The PMM also includes supply voltage supervisor (SVS) and supply voltage monitoring (SVM) circuitry, as well as brownout protection. The brownout circuit is implemented to provide the proper internal reset signal to the device during power-on and power-off. The SVS/SVM circuitry detects if the supply voltage drops below a user-selectable level and supports both supply voltage supervision (the device is automatically reset) and supply voltage monitoring (SVM, the device is not automatically reset). SVS and SVM circuitry is available on the primary supply and core supply.

### Digital I/O

There are up to five 8-bit I/O ports implemented: ports P1 through P5.

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Programmable pullup or pulldown on all ports.
- Programmable drive strength on all ports.
- Edge-selectable interrupt input capability for all the eight bits of ports P1 and P2.
- Read/write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise (P1 through P5) or word-wise in pairs (PA and PB).

## Port Mapping Controller

The port mapping controller allows the flexible and re-configurable mapping of digital functions to port pins of ports P1 through P3.

(1) Input or output function is selected by the corresponding setting in the port direction register PxDIR.

(2) UART or SPI functionality is determined by the selected USCI mode.

(3) UCA0CLK function takes precedence over UCB0STE function. If the mapped pin is required as UCA0CLK input or output USCI\_B0 will be forced to 3-wire SPI mode even if 4-wire mode is selected.

(4) SPI or I2C functionality is determined by the selected USCI mode. In case the I2C functionality is selected the output of the mapped pin drives only the logical 0 to V<sub>SS</sub> level.

(5) UCB0CLK function takes precedence over UCA0STE function. If the mapped pin is required as UCB0CLK input or output USCI\_A0 will be forced to 3-wire SPI mode even if 4-wire mode is selected.

## System Module (SYS)

The SYS module handles many of the system functions within the device. These include power on reset and power up clear handling, NMI source selection and management, reset interrupt vector generators, boot strap loader entry mechanisms, as well as, configuration management (device descriptors). It also includes a data exchange mechanism via JTAG called a JTAG mailbox that can be used in the application.

## DMA Controller

The DMA controller allows movement of data from one memory address to another without CPU intervention. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral.

(1) Reserved DMA triggers may be used by other devices in the family. Reserved DMA triggers will not cause any DMA trigger event when selected.

(2) Only on CC430F613x and CC430F513x. Reserved on CC430F612x.

## Watchdog Timer (WDT\_A)

The primary function of the watchdog timer is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the timer can be configured as an interval timer and can generate interrupts at selected time intervals.

## **CRC16**

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 module signature is based on the CRC-CCITT standard.

## **Hardware Multiplier**

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-bit, 24-bit, 16-bit, and 8-bit operands. The module is capable of supporting signed and unsigned multiplication as well as signed and unsigned multiply and accumulate operations.

## **AES128 Accelerator**

The AES accelerator module performs encryption and decryption of 128-bit data with 128-bit keys according to the Advanced Encryption Standard (AES) (FIPS PUB 197) in hardware.

## **Universal Serial Communication Interface (USCI)**

The USCI module is used for serial data communication. The USCI module supports synchronous communication protocols such as SPI (3 or 4 pin) and I<sup>2</sup>C, and asynchronous communication protocols such as UART, enhanced UART with automatic baudrate detection, and IrDA.

The USCI\_An module provides support for SPI (3 or 4 pin), UART, enhanced UART, and IrDA.

The USCI\_Bn module provides support for SPI (3 or 4 pin) and I2C.

A USCI\_A0 and USCI\_B0 module are implemented.

**TA0**

TA0 is a 16-bit timer/counter (Timer\_A type) with five capture/compare registers. TA0 can support multiple capture/compares, PWM outputs, and interval timing. TA0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

(1) If a different RFCLK divider setting is selected for a radio GDO output, this divider setting is also used for the Timer\_A INCLK.

(2) Only on CC430F613x and CC430F513x

## TA1

TA1 is a 16-bit timer/counter (Timer\_A type) with three capture/compare registers. TA1 can support multiple capture/compares, PWM outputs, and interval timing. TA1 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

(1) If a different RFCLK divider setting is selected for a radio GDO output, this divider setting is also used for the Timer\_A INCLK.

## Real-Time Clock (RTC\_A)

The RTC\_A module can be used as a general-purpose 32-bit counter (counter mode) or as an integrated real-time clock (RTC) (calendar mode). In counter mode, the RTC\_A also includes two independent 8-bit timers that can be cascaded to form a 16-bit timer/counter. Both timers can be read and written by software. Calendar mode integrates an internal calendar which compensates for months with less than 31 days and includes leap year correction. The RTC\_A also supports flexible alarm functions and offset-calibration hardware.

## REF Voltage Reference

The reference module (REF) is responsible for generation of all critical reference voltages that can be used by the various analog peripherals in the device. These include the ADC12\_A, LCD\_B, and COMP\_B modules.

## LCD\_B (Only CC430F613x and CC430F612x)

The LCD\_B driver generates the segment and common signals required to drive a Liquid Crystal Display (LCD). The LCD\_B controller has dedicated data memories to hold segment drive information. Common and segment signals are generated as defined by the mode. Static, 2-mux, 3-mux, and 4-mux LCDs are supported. The module can provide a LCD voltage independent of the supply voltage with its integrated charge pump. It is possible to control the level of the LCD voltage and thus contrast by software. The module also provides an automatic blinking capability for individual segments.

## Comparator\_B

The primary function of the Comparator\_B module is to support precision slope analog-to-digital conversions, battery voltage supervision, and monitoring of external analog signals.

### **ADC12\_A (Only CC430F613x and CC430F513x)**

The ADC12\_A module supports fast, 12-bit analog-to-digital conversions. The module implements a 12-bit SAR core, sample select control, reference generator and a 16 word conversion-and-control buffer. The conversion-and-control buffer allows up to 16 independent ADC samples to be converted and stored without any CPU intervention.

### **Embedded Emulation Module (EEM, S Version)**

The Embedded Emulation Module (EEM) supports real-time in-system debugging. The S version of the EEM implemented on all devices has the following features:

- Three hardware triggers/breakpoints on memory access
- One hardware trigger/breakpoint on CPU register write access
- Up to four hardware triggers can be combined to form complex triggers/breakpoints
- One cycle counter
- Clock control on module level

## Absolute Maximum Ratings<sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted)

Voltage applied at DVCC and AVCC pins to V <sub>SS</sub>	–0.3 V to 4.1 V
Voltage applied to any pin (excluding V <sub>CORE</sub> , RF_P, RF_N, and R_BIAS) <sup>(2)</sup>	–0.3 V to (V <sub>CC</sub> + 0.3 V), 4.1 V Max
Voltage applied to V <sub>CORE</sub> , RF_P, RF_N, and R_BIAS <sup>(2)</sup>	–0.3 V to 2.0 V
Input RF level at pins RF_P and RF_N	10 dBm
Diode current at any device terminal	±2 mA
Storage temperature range <sup>(3)</sup> , T <sub>stg</sub>	–55°C to 150°C
Maximum junction temperature, T <sub>J</sub>	95°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to V<sub>SS</sub>.
- (3) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

T <sub>A</sub>	Operating free-air temperature		–40		85	°C
T <sub>J</sub>	Operating junction temperature		–40		85	°C
C <sub>VCORE</sub>	Recommended capacitor at V <sub>CORE</sub>			470		nF
C <sub>DVCC</sub> / C <sub>VCORE</sub>	Capacitor ratio of capacitor at DVCC to capacitor at V <sub>CORE</sub>		10			
f <sub>SYSTEM</sub>	Processor (MCLK) frequency <sup>(4)</sup> (see Figure 2)	PMMCOREVx = 0 (default condition)	0		8	MHz
		PMMCOREVx = 1	0		12	MHz
		PMMCOREVx = 2	0		16	MHz
		PMMCOREVx = 3	0		20	MHz

- (1) It is recommended to power AV<sub>CC</sub> and DV<sub>CC</sub> from the same source. A maximum difference of 0.3 V between AV<sub>CC</sub> and DV<sub>CC</sub> can be tolerated during power up and operation.
- (2) Modules may have a different supply voltage range specification. See the specification of the respective module in this data sheet.
- (3) Lowering the high-side SVS level or disabling the high-side SVS might cause the LDO to operate out of regulation but the core voltage will still stay within its limits and is still supervised by the low-side SVS ensuring reliable operation.
- (4) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.

## Recommended Operating Conditions (continued)

		MIN	NOM	MAX	UNIT
P <sub>INT</sub>	Internal power dissipation			$V_{CC} \times I_{(DVCC)}$	W
P <sub>IO</sub>	I/O power dissipation of I/O pins powered by DVCC			$(V_{CC} - V_{IOH}) \times I_{IOH} + V_{IOL} \times I_{IOL}$	W
P <sub>MAX</sub>	Maximum allowed power dissipation, P <sub>MAX</sub> > P <sub>IO</sub> + P <sub>INT</sub>			$(T_J - T_A) / \theta_{JA}$	W

The numbers within the fields denote the supported PMMCOREVx settings.

(1) Selecting reduced drive strength may reduce EMI.

(2) The maximum total current, I<sub>(OHmax)</sub> and I<sub>(OLmax)</sub>, for all outputs combined should not exceed ±48 mA to hold the maximum voltage drop specified.

(3) The maximum total current, I<sub>(OHmax)</sub> and I<sub>(OLmax)</sub>, for all outputs combined should not exceed ±100 mA to hold the maximum voltage drop specified.

(4) A resistive divider with 2 × R1 between V<sub>CC</sub> and V<sub>SS</sub> is used as load. The output is connected to the center tap of the divider. For full drive strength, R1 = 550 Ω. For reduced drive strength, R1 = 1.6 kΩ. C<sub>L</sub> = 20 pF is connected to the output to V<sub>SS</sub>.

(5) The output voltage reaches at least 10% and 90% V<sub>CC</sub> at the specified toggle frequency.

- (1) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
  - (a) Keep the trace between the device and the crystal as short as possible.
  - (b) Design a good ground plane around the oscillator pins.
  - (c) Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
  - (d) Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
  - (e) Use assembly materials and praxis to avoid any parasitic load on the oscillator XIN and XOUT pins.
  - (f) If conformal coating is used, ensure that it does not induce capacitive/resistive leakage between the oscillator pins.
- (2) When XT1BYPASS is set, XT1 circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this datasheet.
- (3) Maximum frequency of operation of the entire device cannot be exceeded.
- (4) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the XT1DRIVE<sub>x</sub> settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
  - (a) For XT1DRIVE<sub>x</sub> = 0, C<sub>L,eff</sub> ≤ 6 pF
  - (b) For XT1DRIVE<sub>x</sub> = 1, 6 pF ≤ C<sub>L,eff</sub> ≤ 9 pF
  - (c) For XT1DRIVE<sub>x</sub> = 2, 6 pF ≤ C<sub>L,eff</sub> ≤ 10 pF
  - (d) For XT1DRIVE<sub>x</sub> = 3, C<sub>L,eff</sub> ≥ 6 pF
- (5) Includes parasitic bond and package capacitance (approximately 2 pF per pin).  
Because the PCB adds additional capacitance, it is recommended to verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- (6) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
- (7) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies in between might set the flag.
- (8) Measured with logic-level input frequency but also applies to operation with crystals.

- (1) This value represents the time from the wakeup event to the first active edge of MCLK. The wakeup time depends on the performance mode of the low side supervisor (SVS<sub>L</sub>) and low side monitor (SVM<sub>L</sub>). Fastest wakeup times are possible with SVS<sub>L</sub> and SVM<sub>L</sub> in full performance mode or disabled when operating in AM, LPM0, and LPM1. Various options are available for SVS<sub>L</sub> and SVM<sub>L</sub> while operating in LPM2, LPM3, and LPM4. See the *Power Management Module and Supply Voltage Supervisor* chapter in the *CC430 Family User's Guide* (SLAU259).
- (2) This value represents the time from the wakeup event to the first active edge of MCLK. The wakeup time depends on the performance mode of the low side supervisor (SVS<sub>L</sub>) and low side monitor (SVM<sub>L</sub>). In this case, the SVS<sub>L</sub> and SVM<sub>L</sub> are in normal mode (low current) mode when operating in AM, LPM0, and LPM1. Various options are available for SVS<sub>L</sub> and SVM<sub>L</sub> while operating in LPM2, LPM3, and LPM4. See the *Power Management Module and Supply Voltage Supervisor* chapter in the *CC430 Family User's Guide* (SLAU259).

(1) The leakage current is specified by the digital I/O input leakage.

(2) The analog input voltage range must be within the selected reference voltage range V<sub>R+</sub> to V<sub>R-</sub> for valid conversion results. If the reference voltage is supplied by an external source or if the internal reference voltage is used and REFOUT = 1, then decoupling capacitors are required. See [REF, External Reference](#) and [REF, Built-In Reference](#).

(3) The internal reference supply current is not included in current consumption parameter I<sub>ADC12\_A</sub>.

The specified performance of the ADC12 linearity is ensured when using the ADC12OSC. For other clock sources, the specified performance of the ADC12 linearity is ensured with f<sub>ADC12CLK</sub> maximum of 5.0 MHz.

(2) SREF2 = 0, SREF1 = 1, SREF0 = 0, ADC12SR = 0, REFOUT = 1

(3) SREF2 = 0, SREF1 = 1, SREF0 = 0, ADC12SR = 0, REFOUT = 0. The specified performance of the ADC12 linearity is ensured when using the ADC12OSC divided by 2.

(4) The ADC12OSC is sourced directly from MODOSC inside the UCS.

(5) 13 × ADC12DIV × 1/f<sub>ADC12CLK</sub>

(6) Approximately ten Tau (τ) are needed to get an error of less than ±0.5 LSB:

t<sub>Sample</sub> = ln(2<sup>n+1</sup>) × (R<sub>S</sub> + R<sub>I</sub>) × C<sub>I</sub> + 800 ns, where n = ADC resolution = 12, R<sub>S</sub> = external source resistance

(1) Parameters are derived using the histogram method.

(2) The external reference voltage is selected by: SREF2 = 0 or 1, SREF1 = 1, SREF0 = 0. dVREF = V<sub>R+</sub> - V<sub>R-</sub>, V<sub>R+</sub> < AVCC, V<sub>R-</sub> > AVSS. Unless otherwise mentioned, dVREF > 1.5 V. Impedance of the external reference voltage R < 100 Ω and two decoupling capacitors, 10 μF and 100 nF, should be connected to VREF+/VREF- to decouple the dynamic current. - (1) The temperature sensor is provided by the REF module. See the REF module parametric,  $I_{REF+}$ , regarding the current consumption of the temperature sensor.
- (2) The temperature sensor offset can be as much as  $\pm 20^\circ\text{C}$ . A single-point calibration is recommended in order to minimize the offset error of the built-in temperature sensor.
- (3) The device descriptor structure contains calibration values for  $30^\circ\text{C} \pm 3^\circ\text{C}$  and  $85^\circ\text{C} \pm 3^\circ\text{C}$  for each of the available reference voltage levels. The sensor voltage can be computed as  $V_{SENSE} = TC_{SENSOR} * (\text{Temperature}, ^\circ\text{C}) + V_{SENSOR}$ , where  $TC_{SENSOR}$  and  $V_{SENSOR}$  can be computed from the calibration values for higher accuracy.
- (4) The typical equivalent impedance of the sensor is 51 k $\Omega$ . The sample time required includes the sensor-on time  $t_{SENSOR(on)}$ .
- (5) The on-time  $t_{VMID(on)}$  is included in the sampling time  $t_{VMID(sample)}$ ; no additional on time is needed.

- (1) The external reference is used during ADC conversion to charge and discharge the capacitance array. The input capacitance, C<sub>i</sub>, is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 12-bit accuracy.
- (2) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
- (3) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
- (4) The accuracy limits minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.
- (5) Two decoupling capacitors, 10 μF and 100 nF, should be connected to VREF to decouple the dynamic current required for an external reference source if it is used for the ADC12\_A. See also the *CC430 Family User's Guide* (SLAU259).

- (1) The reference is supplied to the ADC by the REF module and is buffered locally inside the ADC. The ADC uses two internal buffers, one smaller and one larger for driving the V<sub>REF+</sub> terminal. When REFOUT = 1, the reference is available at the V<sub>REF+</sub> terminal, as well as, used as the reference for the conversion and utilizes the larger buffer. When REFOUT = 0, the reference is only used as the reference for the conversion and utilizes the smaller buffer.
- (2) The internal reference current is supplied via terminal AV<sub>CC</sub>. Consumption is independent of the ADC12ON control bit, unless a conversion is active. The REFON bit enables to settle the built-in reference before starting an A/D conversion. REFOUT = 0 represents the current contribution of the smaller buffer. REFOUT = 1 represents the current contribution of the larger buffer without external load.
- (3) The temperature sensor is provided by the REF module. Its current is supplied via terminal AV<sub>CC</sub> and is equivalent to I<sub>REF+</sub> with REFON = 1 and REFOUT = 0.
- (4) Contribution only due to the reference and buffer including package. This does not include resistance due to PCB trace, etc.
- (5) Calculated using the box method: (MAX(-40 to 85°C) – MIN(-40 to 85°C)) / MIN(-40 to 85°C)/(85°C – (-40°C)).
- (6) The condition is that the error in a conversion started after t<sub>REFON</sub> is less than ±0.5 LSB. The settling time depends on the external capacitive load when REFOUT = 1.

(1) All measurement results are obtained using the EM430F6137RF900 with BOM according to tested frequency range (see Table 48).

(2) Sensitivity can be traded for current consumption by setting MDMCFG2.DEM\_DCFILT\_OFF=1. The typical current consumption is then reduced by about 2mA close to the sensitivity limit. The sensitivity is typically reduced to -107dBm

(3) See Design Note *DN010 Close-in Reception with CC1101*, literature number [SWRA147](#).

(4) See Figure 22 for blocking performance at other offset frequencies.

(5) See Figure 23 for blocking performance at other offset frequencies.

(6) Sensitivity can be traded for current consumption by setting MDMCFG2.DEM\_DCFILT\_OFF=1. The typical current consumption is then reduced by about 2mA close to the sensitivity limit. The sensitivity is typically reduced to -100dBm.

(7) MDMCFG2.DEM\_DCFILT\_OFF = 1 cannot be used for data rates ≥ 250kBaud.

(1) All measurement results are obtained using the EM430F6137RF900 with BOM according to tested frequency range (see [Table 48](#)).

(2) Differential impedance as seen from the RF-port (RF\_P and RF\_N) towards the antenna. Follow the CC430 reference designs available from the TI website.

(3) Output power is programmable, and full range is available in all frequency bands. Output power may be restricted by regulatory limits. See also Application Note *AN050 Using the CC1101 in the European 868MHz SRD Band*, literature number [SWRA146](#) and Design Note *DN013 Programming Output Power on CC1101*, literature number [SWRA168](#), which gives the output power and harmonics when using multi-layer inductors. The output power is then typically +10 dBm when operating at 868/915 MHz.

(4) The antennas used during the radiated measurements (SMAFF-433 from R.W.Badland and Nearson S331 868/915) play a part in attenuating the harmonics.

(5) Measured on EM430F6137RF900 with CW, maximum output power

(6) All harmonics are below -41.2 dBm when operating in the 902 – 928 MHz band.

(7) Requirement is -20 dBc under FCC 15.247

(8) All radiated spurious emissions are within the limits of ETSI. Also see Design Note *DN017 CC11xx 868/915 MHz RF Matching*, literature number [SWRA168](#).

(2) The resolution (in Hz) is equal for all frequency bands.

(3) Depends on crystal used. Required accuracy (including temperature and aging) depends on frequency band and channel bandwidth / spacing.

(4) Time from leaving the IDLE state until arriving in the RX, FSTXON, or TX state, when not performing calibration.

(5) Settling time for the 1-IF frequency step from RX to TX

(6) Settling time for the 1-IF frequency step from TX to RX

(7) Calibration can be initiated manually or automatically before entering or after leaving RX/TX.

(3) Setting P1SEL.x bit together with P1MAPx = PM\_ANALOG disables the output driver as well as the input Schmitt trigger.

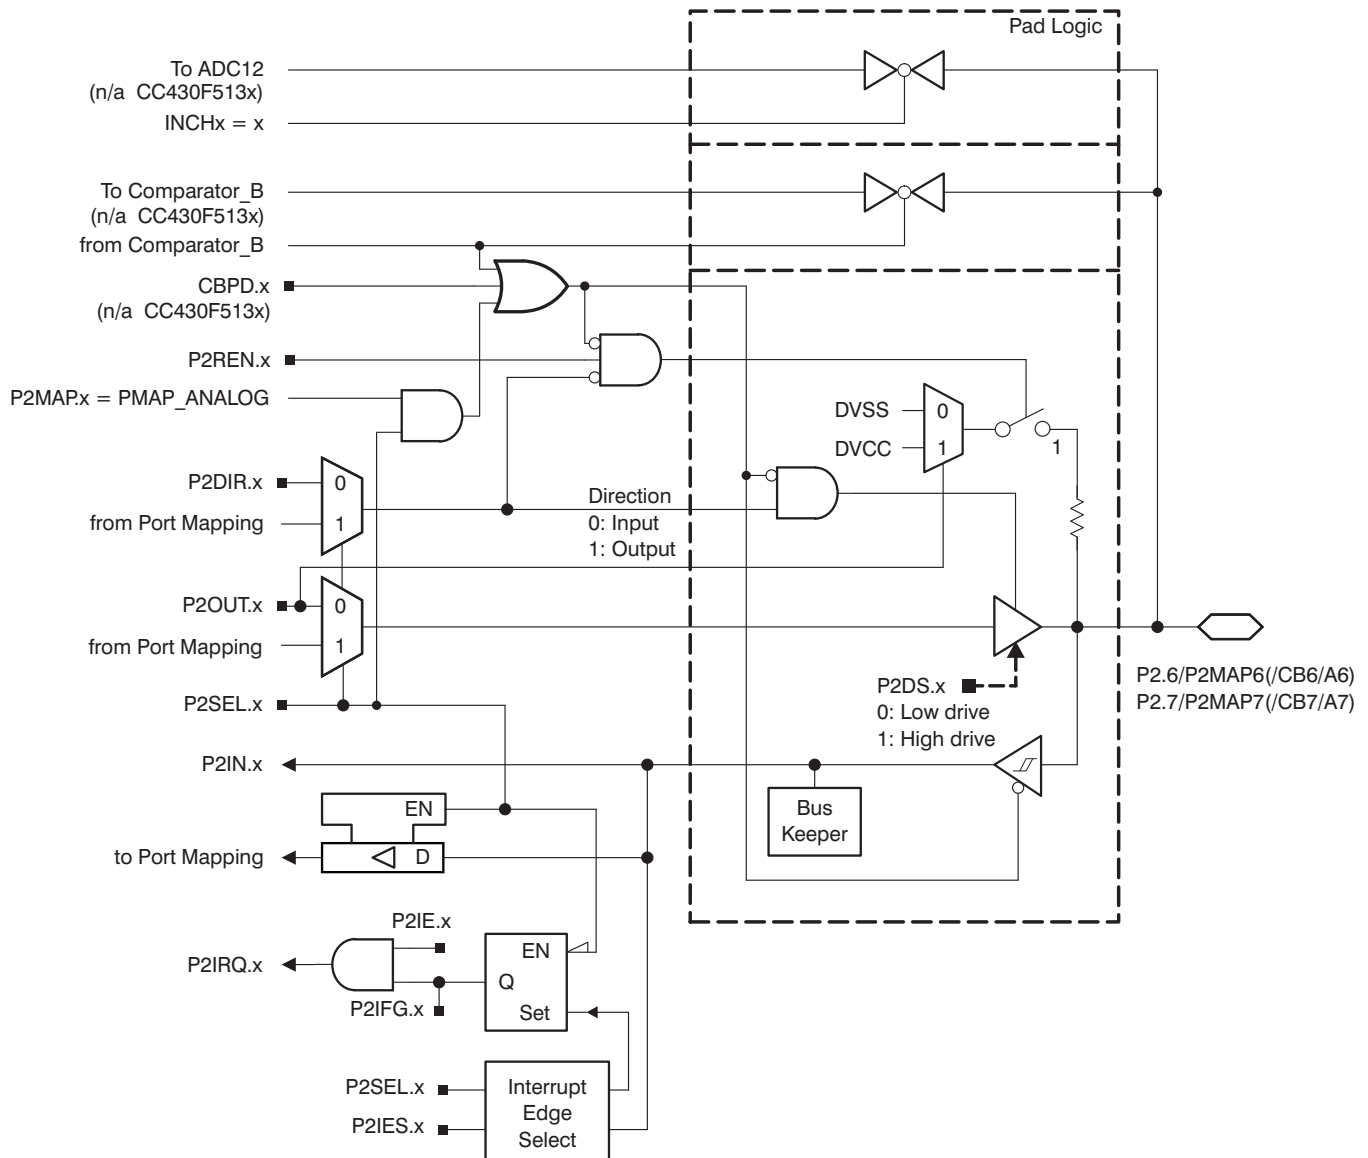

## Port P2, P2.0 to P2.3, Input/Output With Schmitt Trigger

## Port P2, P2.4 to P2.5, Input/Output With Schmitt Trigger

## Port P2, P2.6 and P2.7, Input/Output With Schmitt Trigger

CC430F513x devices don't provide analog functionality on port P2.6 and P2.7 pins.

(1) X = don't care

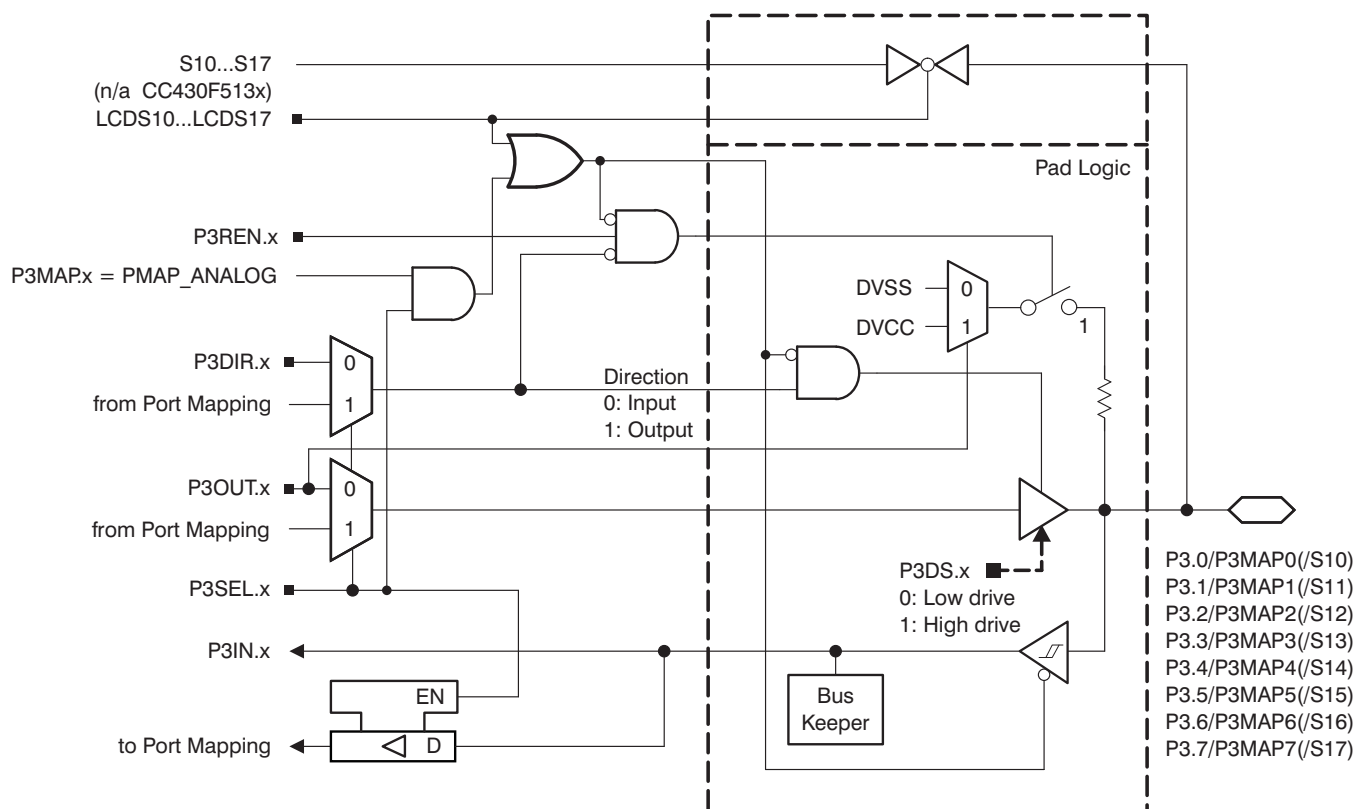

(2) According to mapped function - see [Table 9](#).

(3) Setting P2SEL.x bit together with P2MAPx = PM\_ANALOG disables the output driver as well as the input Schmitt trigger.

(4) Setting the CBPD.x bit disables the output driver as well as the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. Selecting the CBx input pin to the comparator multiplexer with the CBx bits automatically disables output driver and input buffer for that pin, regardless of the state of the associated CBPD.x bit.

## Port P3, P3.0 to P3.7, Input/Output With Schmitt Trigger

## REVISION HISTORY

REVISION	DESCRIPTION
SLAS554	Product Preview data sheet release
SLAS554A	Product Preview data sheet updated with electrical parameters
SLAS554B	Production Data release data sheet for CC430F51xx devices. CC430F61xx devices are Product Preview.
SLAS554C	Production Data release data sheet for CC430F61xx devices.
SLAS554D	Added correct termination of LCDCAP/R33 if not used. Corrected unit in <i>Frequency Synthesizer Characteristics</i> from "ms" to "μs".
SLAS554E	Removed RFRXIFG (14) and RFTXIFG (15) from <i>DMA Trigger Assignments</i> table Corrected USCI control register location in <i>Peripheral File Map</i> . Changed T <sub>stg</sub> maximum limit from 105°C to 150°C in <i>Absolute Maximum Ratings</i> . Replaced values for "Hardware revision" and "Firmware revision" in <i>Device Descriptor Tables</i> with "per unit".
SLAS554F	<a href="#">Table 3</a> , Corrected USCI signal names for pins 5 and 6 (descriptions unchanged). <a href="#">12-Bit ADC, Linearity Parameters Using an External Reference Voltage or AVCC as Reference Voltage</a> , ADC12 linearity parameter test conditions revised. <a href="#">12-Bit ADC, Linearity Parameters Using the Internal Reference Voltage</a> , linearity parameters with internal reference added.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Quad Flatpack, No-leads (QFN) package configuration.
  - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - F. Falls within JEDEC MO-220.

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
